

A window = a fixed 2.56 s slice of the sensor stream (sliding with 50% overlap)

Sampling rate: 50 Hz • 1 window = 128 samples = 2.56 s • stride = 64 samples = 1.28 s (50% overlap)
Each window is classified into ONE activity.

Sensor value (schematic)

Inside one window: 128 timesteps of 9 sensors, plus one activity label and one subject id

One real window — WALKING (subject 1)

Another window — SITTING (subject 1)

The same window feeds two model families in two forms
